Watching TV over IP
On your TV

Items needed

- HDTV
- Laptop or Desktop
- HDMI or VGA Cable (depends on what your computer supports)

How to Connect your Computer to an HDTV

PC

1. First determine whether your computer supports HDMI or only VGA
2. Acquire an HDMI Cable or VGA Cable based on which connection your computer has.
3. Plug one end of cable into the appropriate port on the computer and the other end into the similar looking port on the TV and tune to the appropriate input channel (normally channel 3).

MAC

1. Acquire a Mini Display Port-to-HDMI Adapter and HDMI Cable.
2. Plug Mini Display Port adapter into the computer and then plug the HDMI cable into the Mini Display Port-to-HDMI Adapter.
3. Plug the other end of the HDMI cable into the TV and tune to the HDMI input channel.

Special Notes

- If the computer does not automatically change to external monitor mode, press the external monitor button. Generally, this button will look like a computer next to an external monitor.
- Resolution settings may need to be adjusted for the best viewing experience in Display Settings.

What if I have an older TV that does not support HDMI or VGA?

- Either an HDMI to TV Composite Converter or VGA to TV Converter will be required in order to convert HDMI/VGA/Mini Display to standard definition TV.
